Structural colours in natural organisms

In the biological world, many structural colours produced by the interaction between light and photonic structures

Properties of natural photonic structures

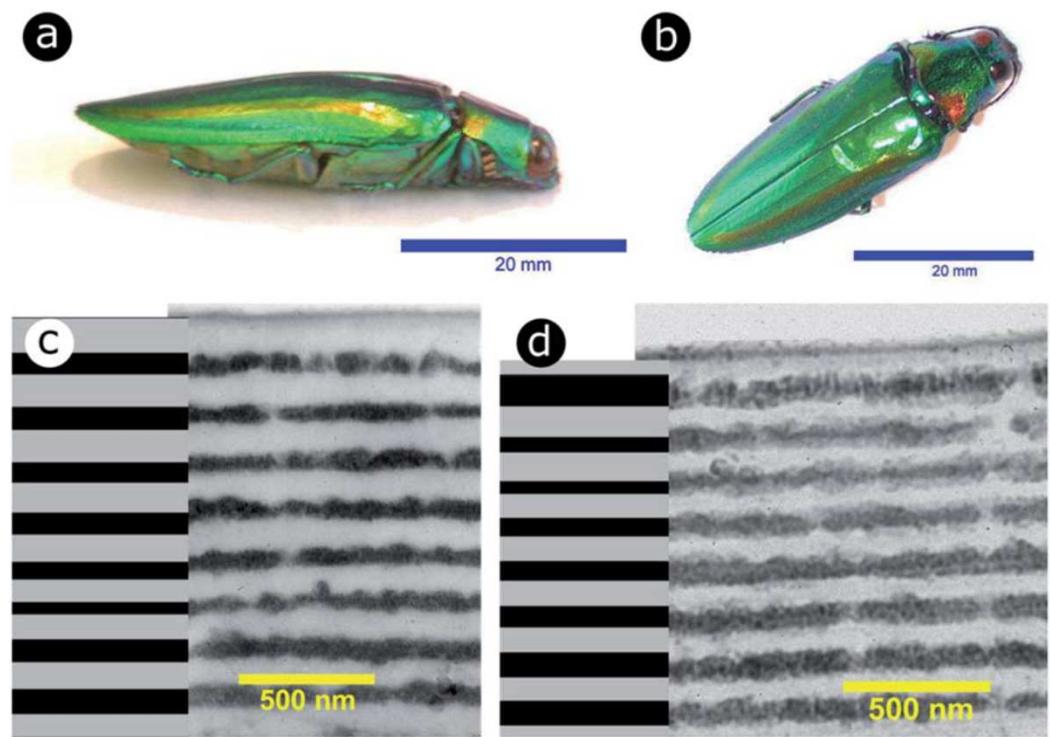

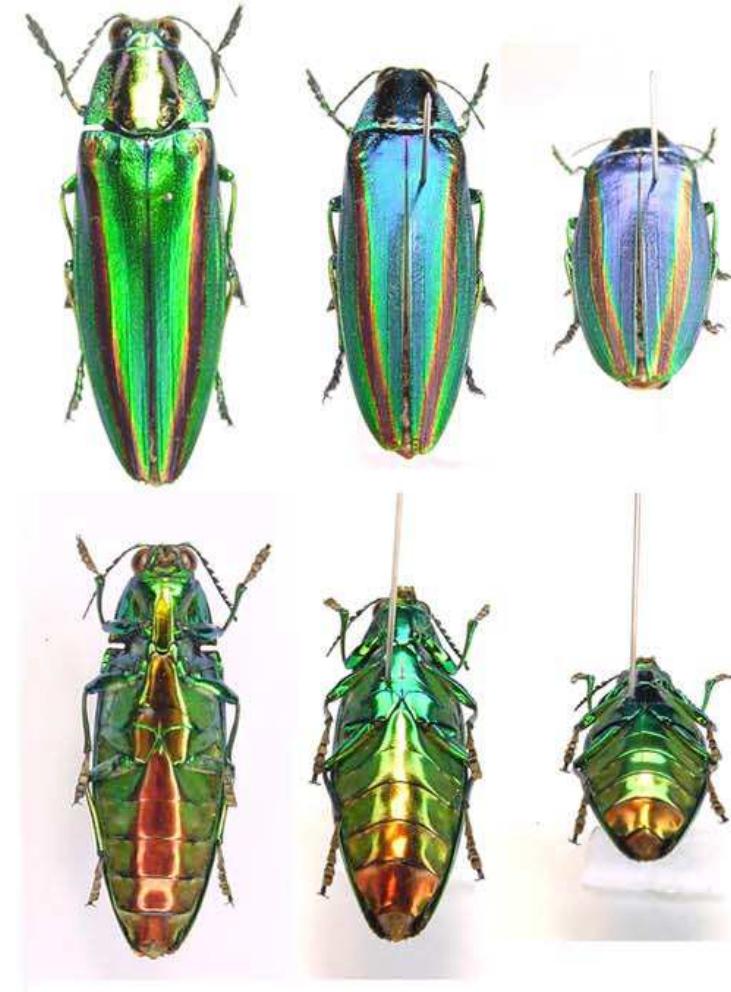

Iridescence

Kinoshita, *Structural Colors in the Realm of Nature*, 2008

Liquid-induced colour change

Charidotella egregia

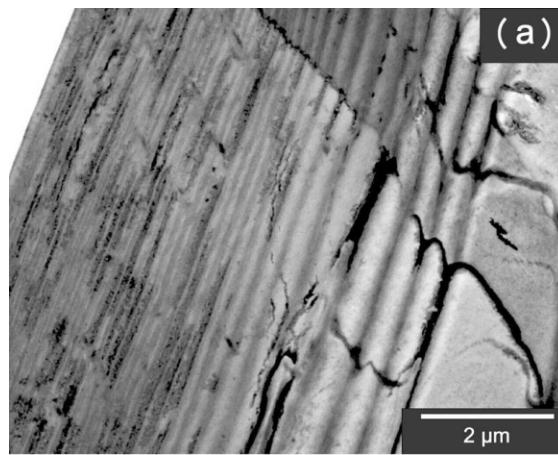

Vigneron et al., PRE 76, 2007

Liquid-induced colour change

Charidotella egregia

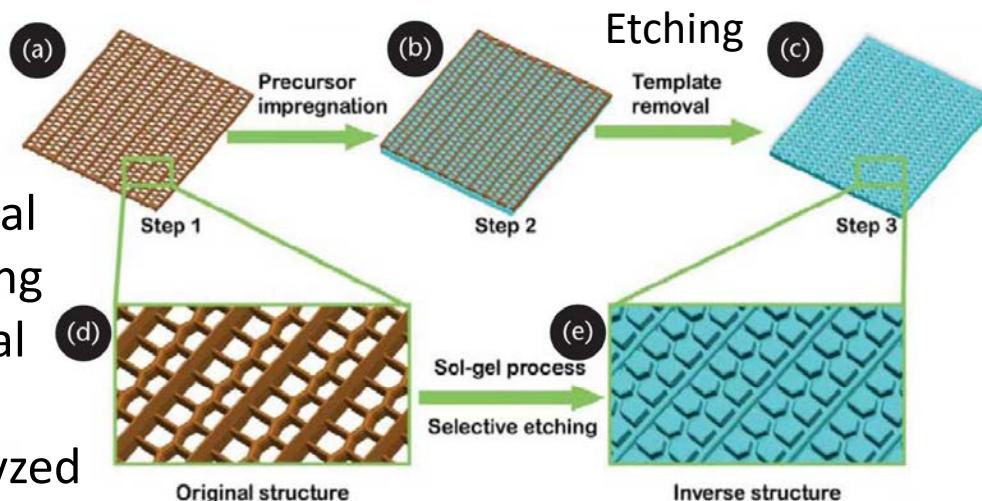

Chirped Bragg mirror

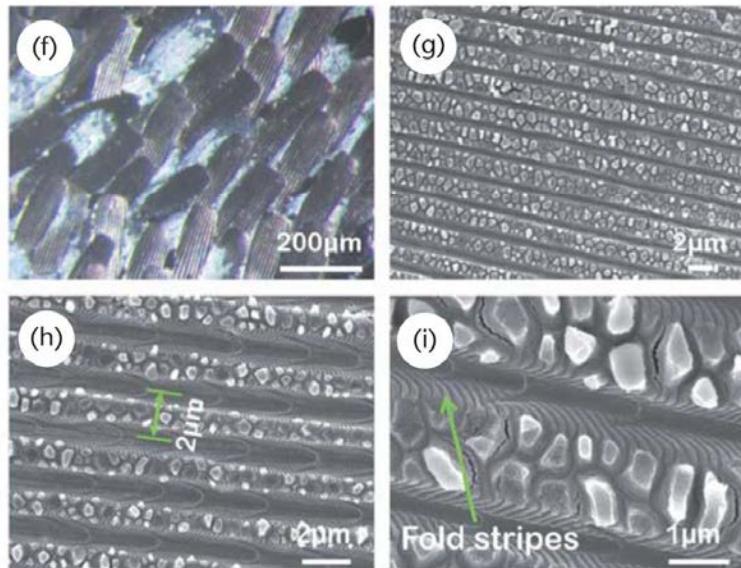

Vigneron et al., PRE 76, 2007

Sol-Gel Methods

Hydrolysis of a colloidal solution (sol) containing precursors (e.g., metal alkoxides) and poly-condensation of hydrolyzed products, leading to the formation of a gel, i.e. a solid, inorganic network containing a liquid phase

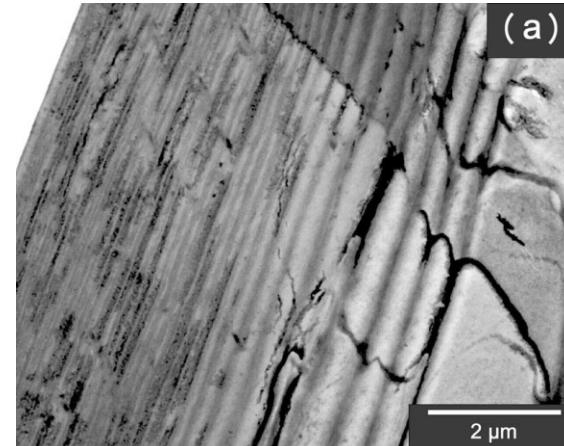

Deposition of SiO_2 , TiO_2 or Al_2O_3

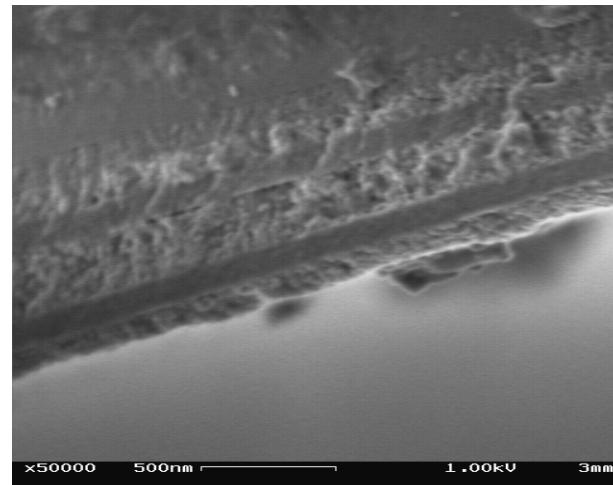

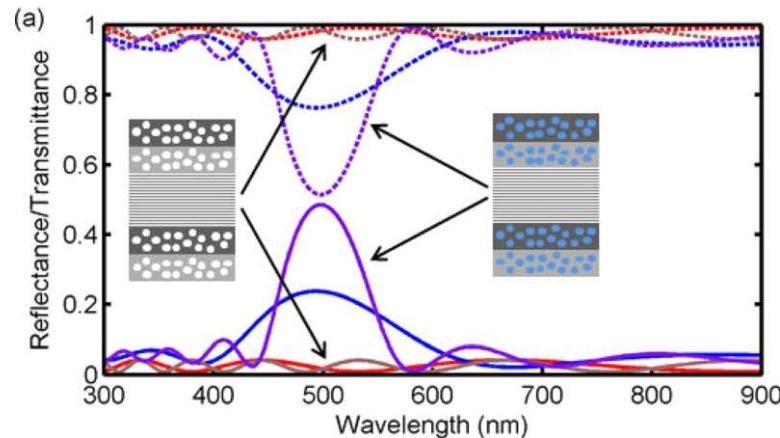

Inverse replica of butterfly wing

Bioinspired smart glass coatings

Charidotella egregia

Vigneron et al., PRE 76, 2007

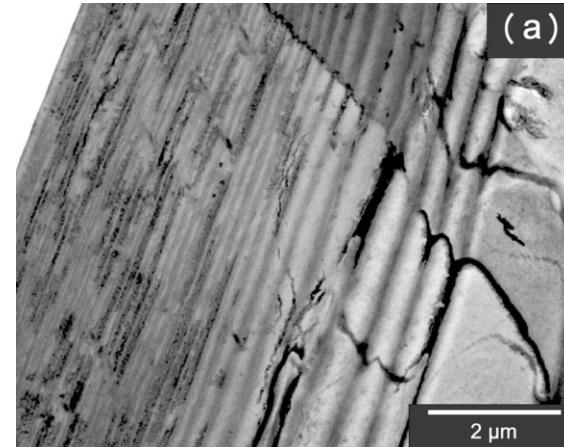

- Glass slide coated with mesoporous oxide Bragg layer stack
- Mesoporous oxides (L_1 layers: $x\text{TiO}_2(1-x)\text{Al}_2\text{O}_3$, L_2 layers: SiO_2) were synthesised by sol-gel method
- Molar ratio x of mixed oxide layers was adjusted in order to get a transparent Bragg mirror in dry condition

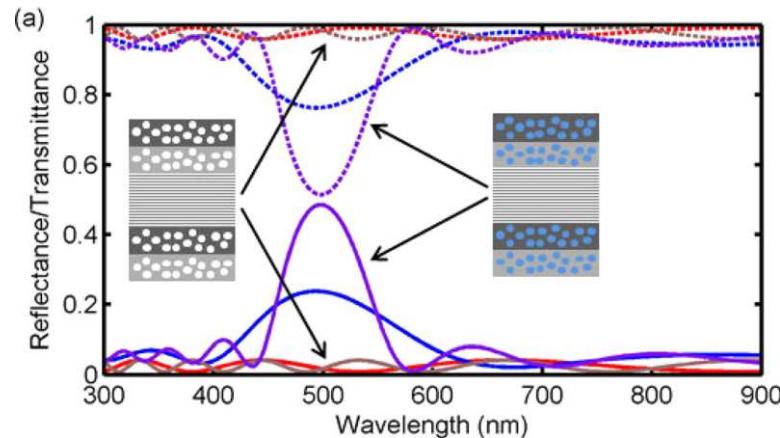

Deparis, Ghazzal, Simonis, Mouchet et al., APL 104, 2014

Bioinspired smart glass coatings

Charidotella egregia

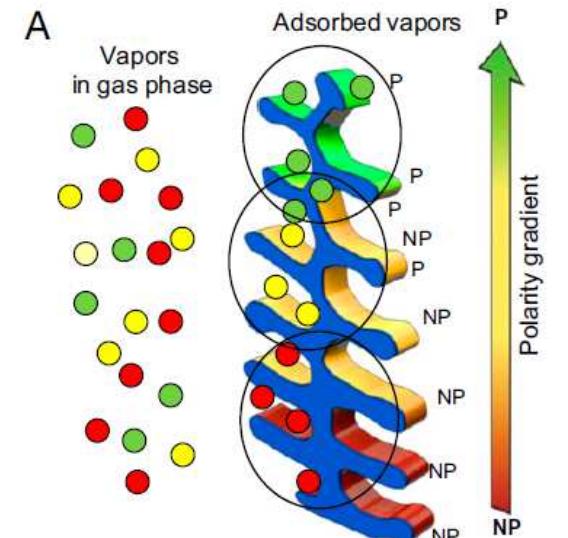

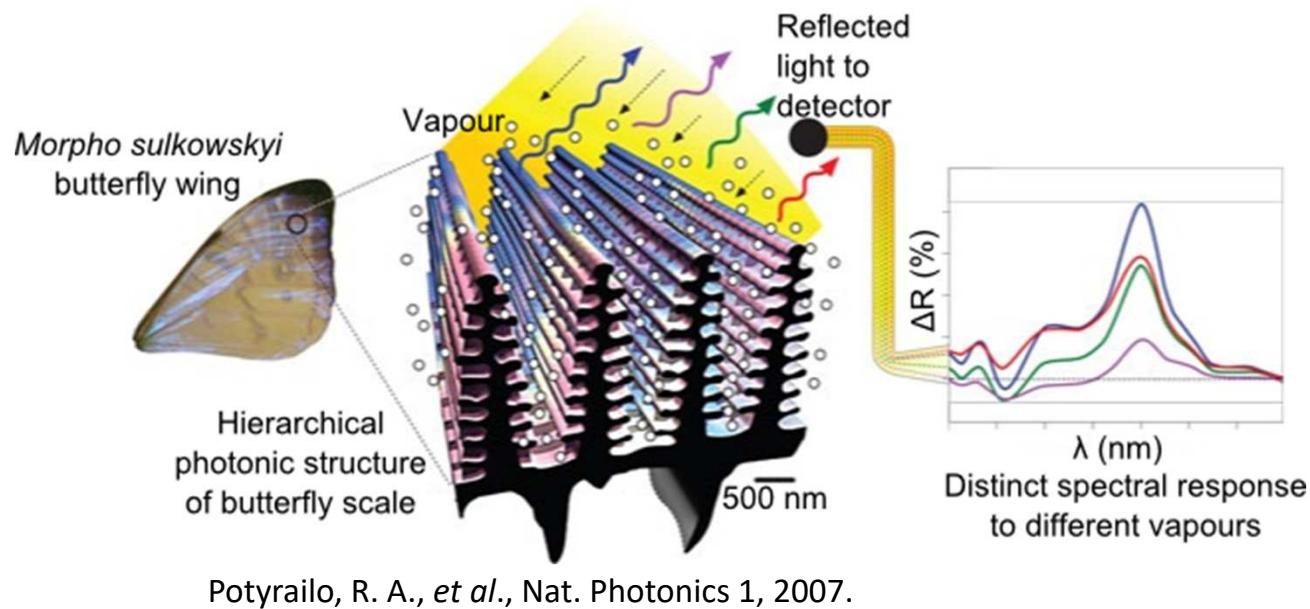

Vigneron et al., PRE 76, 2007

- Glass slide coated with mesoporous oxide Bragg layer stack
- Mesoporous oxides (L_1 layers: $x\text{TiO}_2(1-x)\text{Al}_2\text{O}_3$, L_2 layers: SiO_2) were synthesised by sol-gel method
- Molar ratio x of mixed oxide layers was adjusted in order to get a transparent Bragg stack in dry condition

Gas/vapour-induced colour change

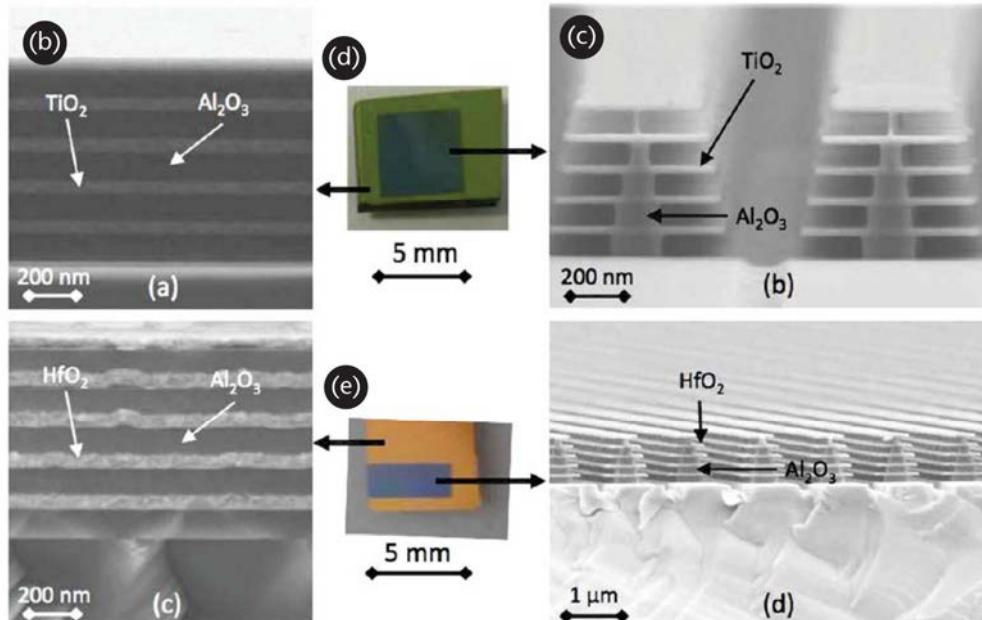

Bioinspired photonic gas/vapour-sensors

Morpho godarti

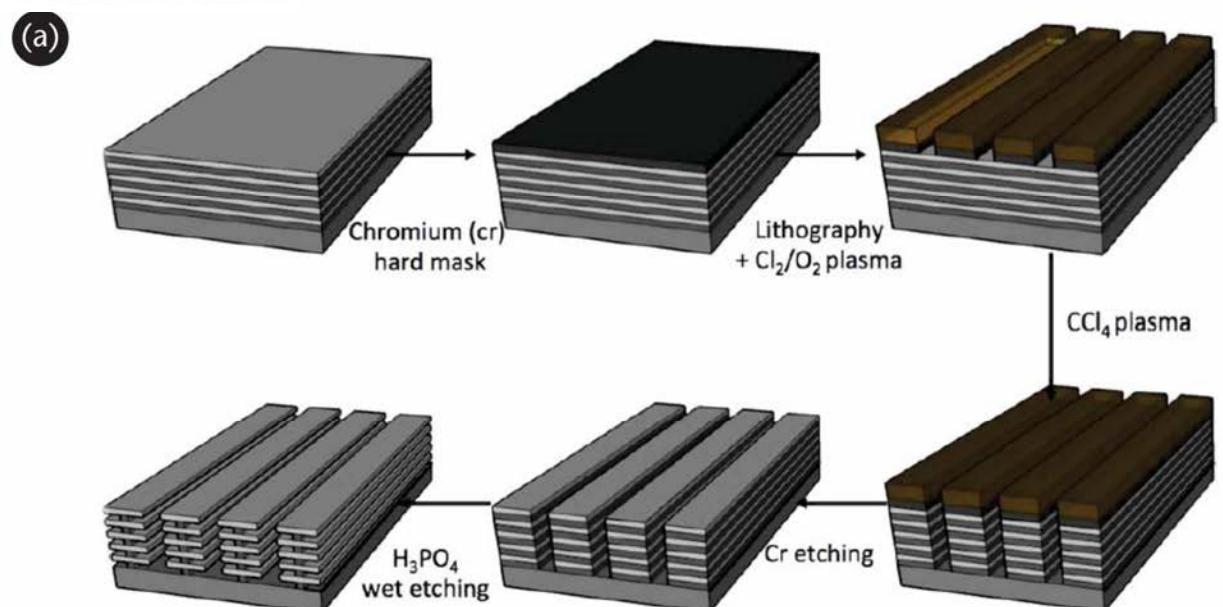

Poncelet, Tallier, Mouchet *et al.*, Bioinspir. Biomim. 11, 2016

Bioinspired photonic gas/vapour-sensors

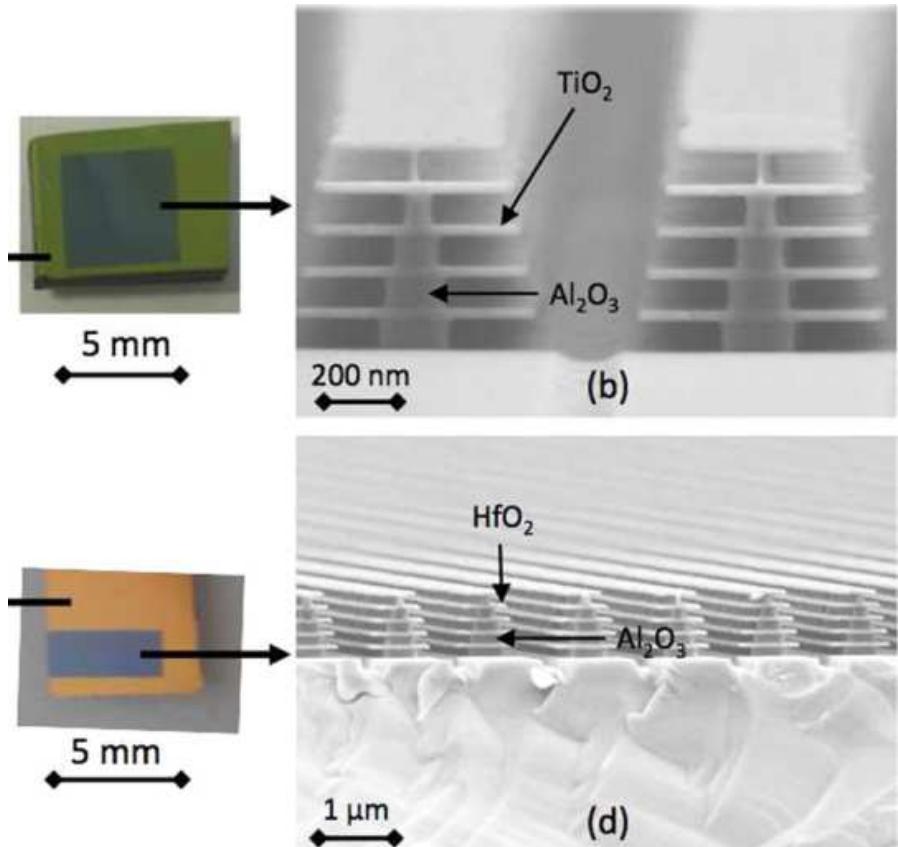

Atomic Layer Deposition

Surface is repeatedly exposed to gas precursors, the adsorption of which forms monolayers

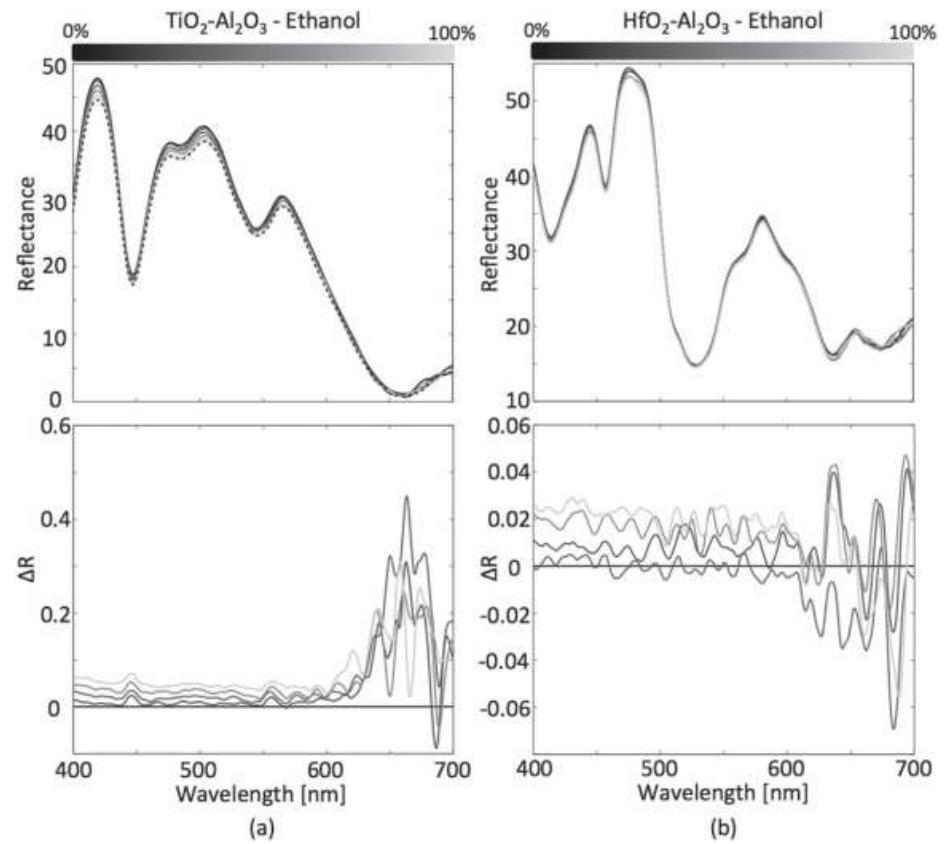

Bioinspired photonic gas/vapour-sensors

Morpho godarti

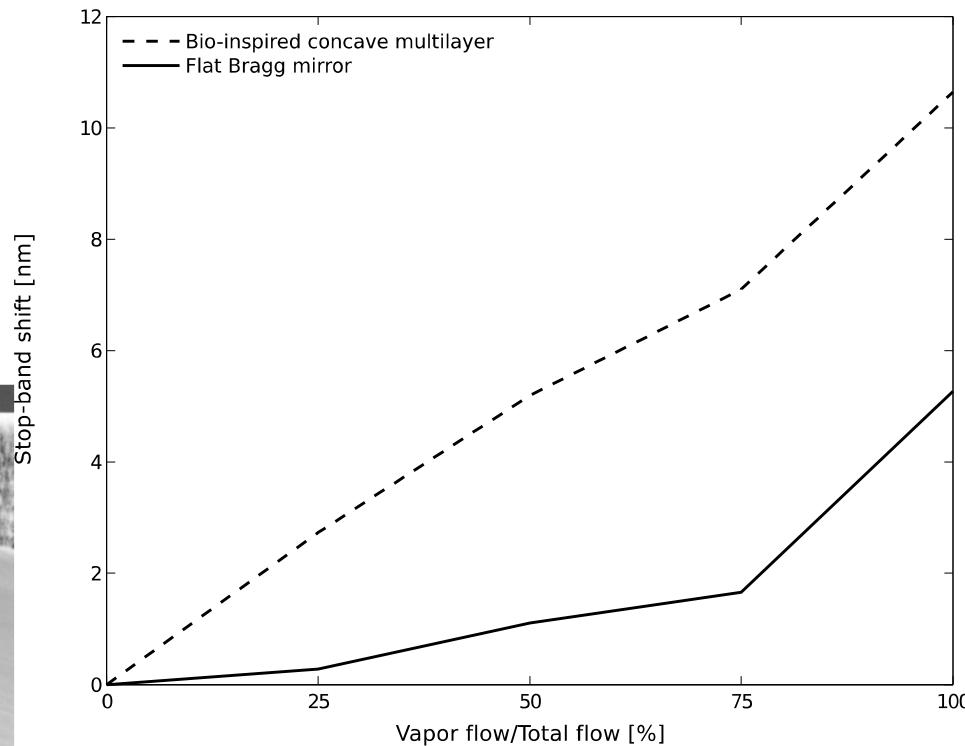

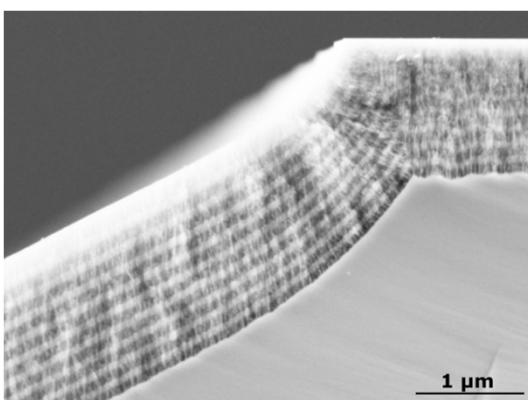

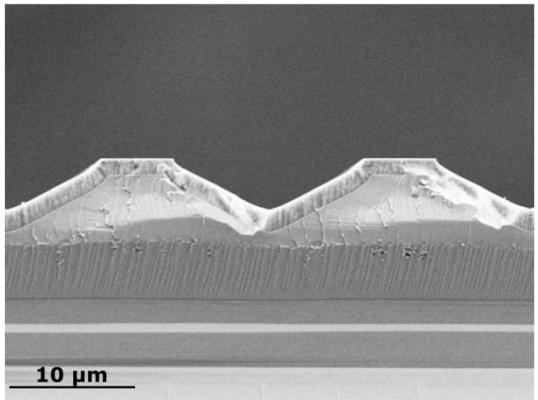

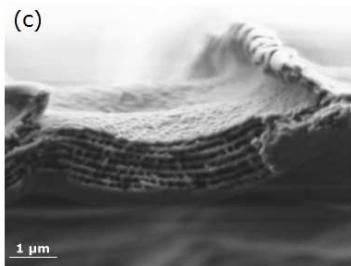

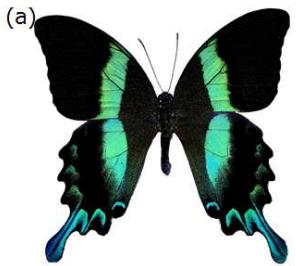

ALD Bragg mirrors of $\text{Al}_2\text{O}_3/\text{TiO}_2$ or $\text{Al}_2\text{O}_3/\text{HfO}_2$ nanostructured by etching

Bioinspired photonic gas/vapour-sensors

Papilio blumei

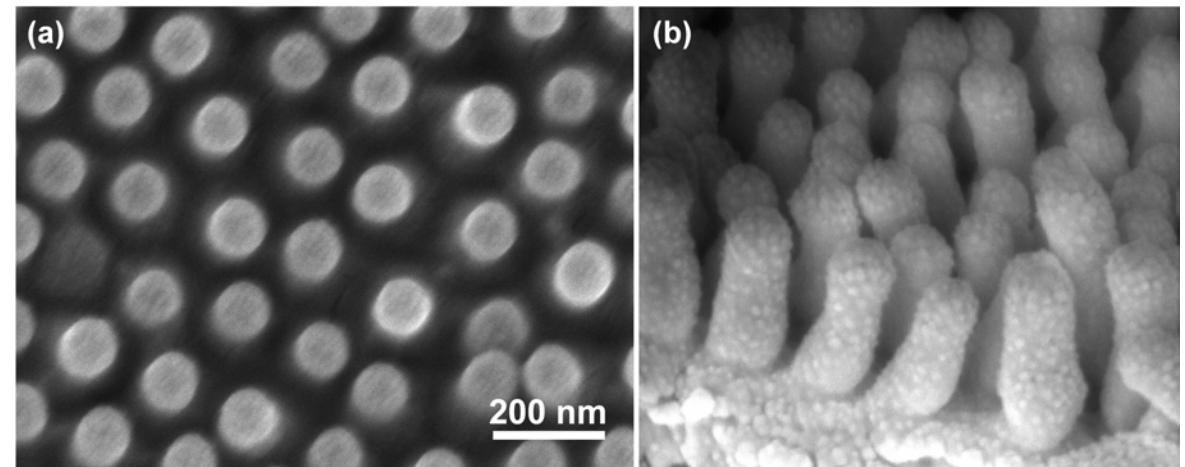

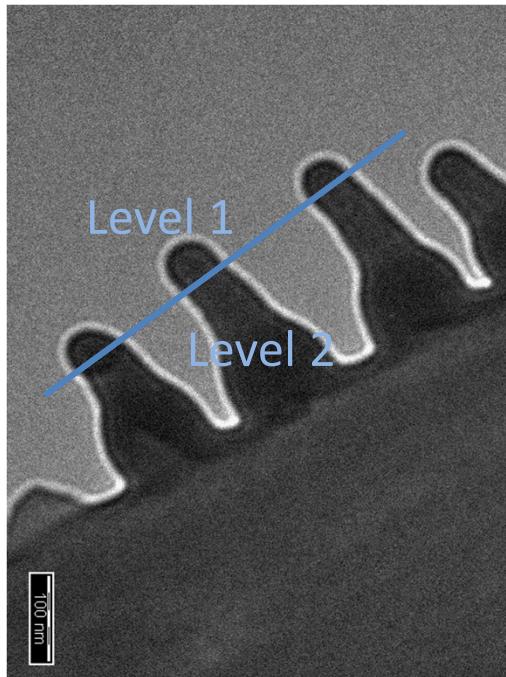

Concave porous silicon multilayer synthesised
by photolithography and etching

Multifunctional nanostructures on the wings of *Cicada orni*

Transparent wings with

- antireflection effect and
- hydrophobic properties

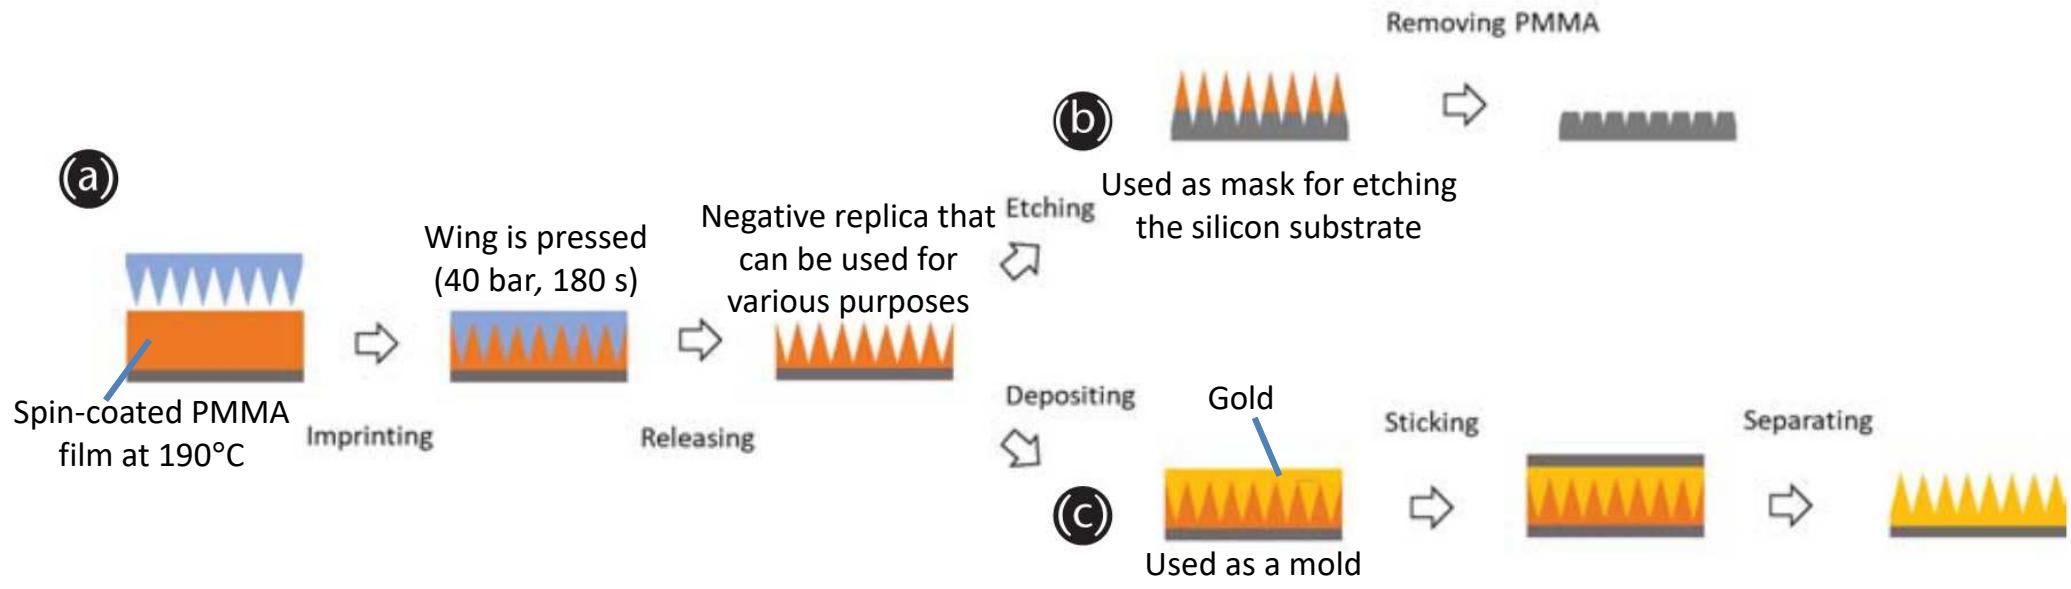

due to a quasi-periodic arrays of hexagonally close-packed protrusions

Dellieu *et al.*, JAP 116, 2014

Deparis, Mouchet *et al.*, Mater. Today: Proc. 1S, 2014

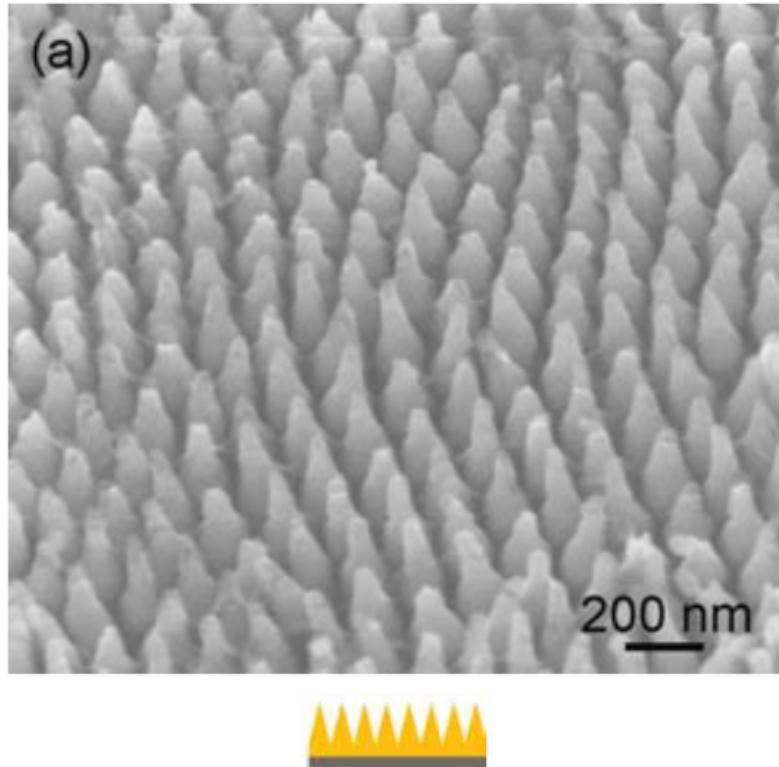

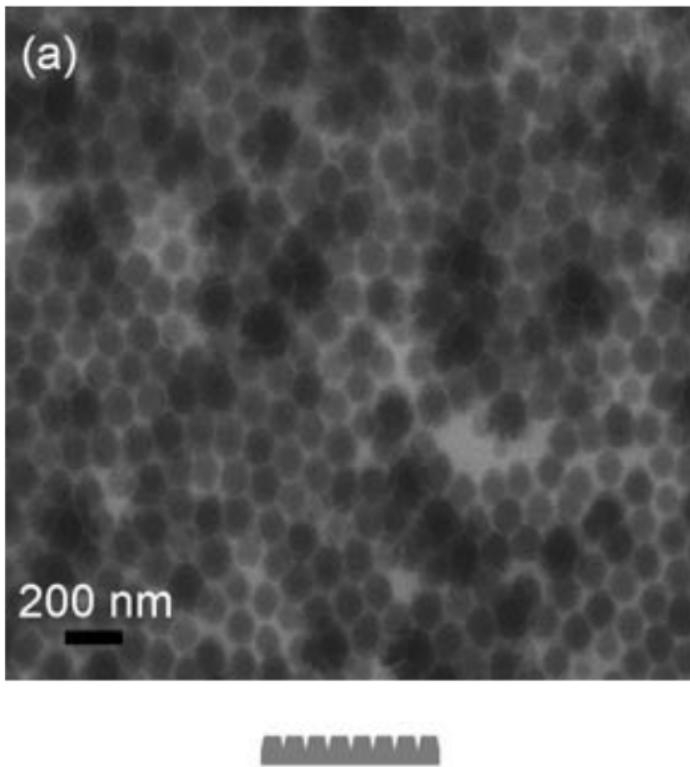

Nanoimprint lithography & cicada wing nanostructures

Chitin structures have good mechanical properties and chemical stability allowing them to withstand imprint process and are reusable

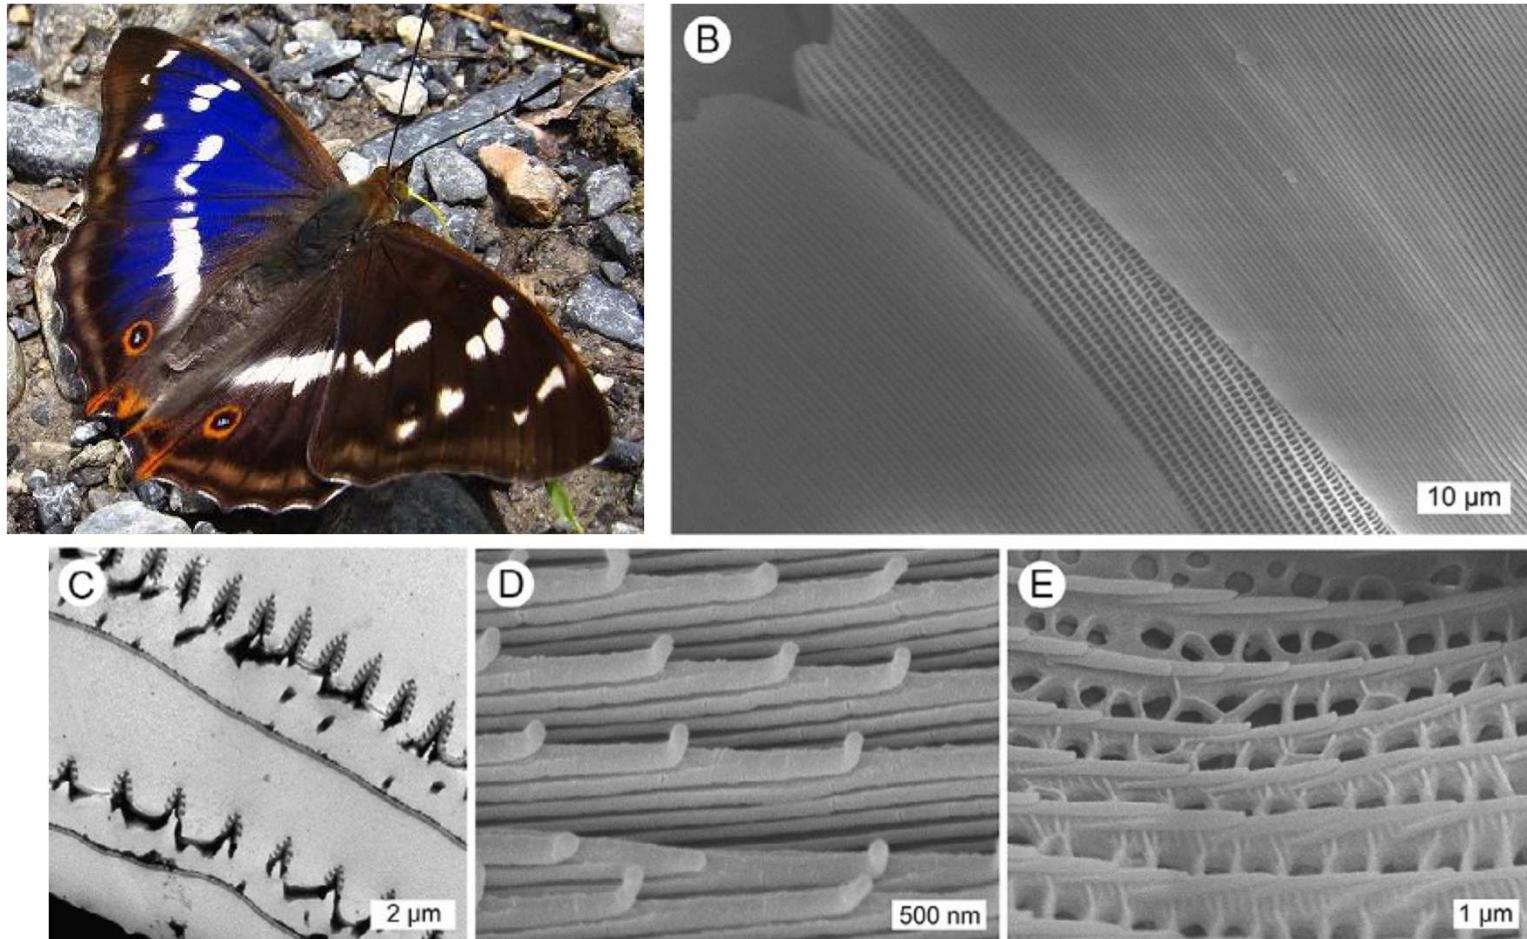

Mouchet & Deparis, Natural Photonics and Bioinspiration, 2021
Zhang *et al.*, Small 2, 2006

Nanoimprint lithography & cicada wing nanostructures

Bioinspired bird-safe windows

Deposition by Physical Vapour Deposition

Conclusion

- **Natural photonic structures** are **sophisticated materials** displaying a **large variety of optical effects**
- Interesting properties: liquid-induced colour change, gas sensitivity, antireflection, UV reflection...
- Studying them allows us to **develop new concepts and applications** through a **bioinspiration** approach that may rely on nanoimprint lithography
